

Product Features & Benefits

Adhesive tapes consist of a number of different components, with the most notable key elements being the film type & adhesive coating. The combination of which can have dramatic performance results.

Therefore choosing the right product composition will ensure optimum protection for your goods during transport, ultimately saving you money. If the sealing is perfect for your application safe transport is guaranteed from loading to final destination.

Backing Types

BOPP Polypropylene: predominantly used in manufacturing of packaging tapes. High temperature resistance & tensile strength in longitudinal & cross direction. Works with all adhesive types.

PVC Polyvinylchloride: widely used in manufacturing of printed packaging tapes as they can be printed on perfectly. Characteristic of providing a silent & smooth unwind with low elongation. Coated with natural rubber adhesive.

PET Polyester: used for manufacturing of specialised tapes that require high tensile strength. A high performance film with low elongation & high temperature resistance.

Kraft: commonly used as paper backing for packaging tapes. Can be supplied plain, reinforced as well as in white & standard brown. Provides an easy unwind & in majority of cases can be recycled depending on its type. Can be coated with various types of adhesives.

Adhesive Types

Natural rubber adhesive: is versatile in use and ensures durable sealing of cardboard packaging even on critical surfaces such as recycled carton and under extreme conditions. Offers high temperature resistance & shear strength.

Hotmelt (Synthetic rubber) adhesive: as the name implies this adhesive is melted from its granular form & applied to film whilst hot. Offers good initial tack & high adhesive strength on steel.

Acrylic (Water based) adhesive: is the most economical adhesive to apply as sprayed directly onto film. Offers good UV, ageing resistance & high transparency.

WAT (Water activated) adhesive: as the name implies this adhesive needs to be exposed to water. It is a starch based adhesive which becomes sticky when moistened. Upon drying out offers a unique tamper evident style bond to variety of surfaces. Can only be used with WAT dispenser.

Packaging Tape Selection Guide

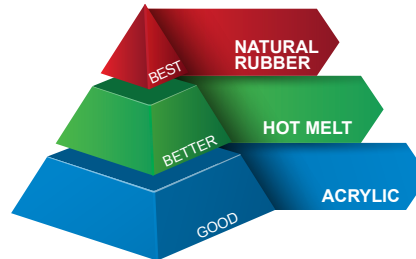

Multiple factors should be considered when selecting the most suitable tape for a particular application. Making the right choice is therefore not as simple as it would seem.

One must take into consideration:

- Surface type
- Carton quality
- Weight
- Storage conditions
- Transportation.

This guide is designed to make this process easier.

Tape solutions made simple!

Disclaimer: The information in this brochure is given in good faith for guidance on Stylus range and not specification purposes. This should not be used to compare with other similar products in the marketplace. The purchaser is solely responsible for determining suitability of these products for their application taking into consideration all the various factors influencing overall performance.
